* Probable maximum. † Mean for one day is approximate. ‡ Means for two days are approximate.

NOTE.—The rainfall values given in these Tables are based on the amounts measured at 10 a.m. each morning, and entered to preceding day. These have been taken in preference to the totals 1 a.m. to Midnight, in order to make the results comparable with those from other stations, but the Monthly totals will therefore differ occasionally from the sum of the daily totals given in the "Hourly Readings."

Table I.—Mean Monthly Results, &c.—*continued.*

NOTE.—Means which are inclosed in brackets are a little doubtful, one of the five daily means being approximate.
Doubtful, two of the five daily means are approximate.

HOURLY READINGS, 1883.

INTRODUCTORY REMARKS.

THE following Tables give for each of the Seven British Self-recording Observatories of the Meteorological Office, for each hour—

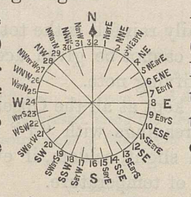
1. Readings of the barometer reduced to 32° Fahrenheit.
2. Readings of the dry-bulb and wet-bulb thermometers.
3. Direction and velocity of the wind.
4. Rainfall.
5. Vapour tension, or proportion of vapour in the air. Also
6. Daily minima, maxima, and range of pressure and temperature.
7. Daily means of the barometer and dry-bulb and wet-bulb thermometers; and
8. Daily total fall of rain.

1. *Pressure.*—The barometer readings are measurements of the photographic barograph curves, made at points two minutes after each hour. They are reduced to 32° Fahrenheit by a mechanical arrangement in the instrument itself, but no correction has been applied for the height of the stations above mean sea level.

The corrections required for the reduction of the readings to the mean sea level are given on page 3.

2. *Temperature.*—The thermometer readings are measurements of the photographic thermograph curves made at points two minutes before each hour, corrected in each case for any instrumental errors. The heights of the bulbs above the ground vary from 4 feet at Armagh to 41 feet at Aberdeen, but no correction for this height has been applied to the readings.

3. *Wind.*—The direction of the wind is that recorded exactly at the hour. It is given according to *true* bearings, in numbers corresponding to the various points of the compass, as shown by the following diagram:—



The velocity of the wind is the space travelled over from 30 minutes before to 30 minutes after the hour. Thus the number of miles recorded from 2.30 p.m. to 3.30 p.m. is set down as the velocity for 3 p.m. The factor 3 (Dr. Robinson's original factor) has been employed for converting the distance actually run by the cups into "space travelled over."

E 15550. 300.—1/85. Wt. 17504. E. & S.

Corrections for the effect of friction have been applied as follows:—

When the tabulated velocity is	0 miles,	correction is	1·5 miles.
„ „ „	1—3 „	„	1·0 „
„ „ „	4—10 „	„	0·5 „
„ „ „	above 10 „	„	0·0 „

4. *Rainfall.*—The rainfall is obtained from the records of Beckley's self-registering gauge, and is the total precipitation for the 60 minutes ending at the hour. Thus the total fall registered in the interval from 1 p.m. to 2 p.m. is taken as the fall for 2 p.m. Occasionally in winter the instrument fails to record in consequence of snow or frost, and no hourly falls can be given. In such cases the amount found in the gauge is measured at about 10 o'clock each morning, and the total fall is inserted in words, as, "Total for preceding 24 hours = ·056." Occasionally also a small quantity of water is found in the rain-gauge in the morning, which, though believed to be rainfall, it is impossible to assign to any particular hour. In such a case the amount will be found entered at 10 a.m. with the note "Measured at 10 a.m." When the amount found in the gauge is known to be *dew*, a note to that effect is inserted.

5. *Vapour Tension.*—This gives the proportion of the total atmospheric pressure which is due to the presence of vapour in the air, expressed in inches of mercury. It is obtained from the readings of the dry-bulb and wet-bulb thermometers by using Glaisher's Hygrometrical Tables, 5th edition, London, 1869. When from any cause the reading of either the dry-bulb or wet-bulb thermometer is missing, if a pair of standard readings are available the latter have always been used in calculating the vapour tension.

6. *Minima and Maxima.*—The minimum and maximum temperatures are the values of the lowest and highest points respectively of the thermograph curves for the 24 hours ending at midnight. For the pressure, however, the lowest and highest *hourly readings* are taken, and, while in some cases these are not the true minima and maxima of the day, the differences are ordinarily but slight.

The daily range is, for both pressure and temperature, the difference between the daily minima and maxima.

7. *Means.*—The daily means of the barometer and thermometer readings are obtained by adding together the hourly readings for each day and dividing the sum by 24. These means are not carried further than to three places of decimals for the pressures, and to one place of decimals for the temperatures. When the final remainder is 12 the last figure is thrown up—thus, 29·7465 is entered as 29·747, 51·25 is entered as 51·3, and so on.

8. *Daily Rainfall.*—The total daily rainfall is the total precipitation for the 24 hours ending at midnight. Where this cannot be given accurately, owing to snowfall, &c., the amount is inserted with a qualifying note.

Time.—Greenwich mean time is kept at all the Observatories, and not local time.

Approximate Readings.—Those readings with "†" are approximate only, but the limit of error may be taken to be slight, seldom, if ever, exceeding 0·01 inch in the case of pressure, and 1°·0 in that of temperature.

Interpolations.—Readings printed in italic type are interpolations which have been used in calculating the means. In some cases the gaps were too great to be bridged over by interpolation, and the spaces are consequently left blank. Means have, however, been calculated for such days, and they will be found entered with the note "probable mean."

Corrections to be applied to the Readings of the Photographic Barometer Curves to reduce them to Mean Sea Level. The readings have already been reduced to 32° Fahrenheit.

(The correction is additive.)

Note.—The corrections given above differ slightly from those found in a corresponding table printed in the "Quarterly Weather Report" for 1869, the reason being that the values on which the table is based were re-calculated in 1875, and published in "Instructions in the Use of Meteorological Instruments," and that these new values have been employed here.

APPENDIX.

Harmonic Analysis of the Diurnal Range of Air Temperature at the Seven Observatories of the Meteorological Office, for the Twelve Years from 1871 to 1882; obtained from the continuous Photographic Records by means of Sir William Thomson's Harmonic Analyser.

THE following tables contain the Harmonic coefficients of the expressions representing the mean daily march of the temperature of the air for each month of the year for the 12 years 1871 to 1882 inclusive, for the seven Self-recording Observatories of the Meteorological Office.

The numerical results have been obtained directly from the continuous photographic records of temperature by the use of the Harmonic Analyser,—an integrating instrument designed by Sir William Thomson, F.R.S., the principle of which he has described in two papers, which will be found in the "Proceedings of the Royal Society," Vol. XXIV. p. 262, and Vol. XXVII. p. 371.

The machine specially constructed for the Meteorological Office furnishes the values of the three first pairs of coefficients, as well as of the mean, in the equation—

$$E = a_0 + a_1 \cos\theta + b_1 \sin\theta + a_2 \cos 2\theta + b_2 \sin 2\theta + a_3 \cos 3\theta + b_3 \sin 3\theta \text{ \&c.,}$$

and its mechanical arrangements are suited to the work for which it was specially intended. At the outset an exhaustive series of experiments and trials was carried out in order to test thoroughly the capabilities of the machine and the amount of confidence which might be placed in the results it yielded. The outcome of these tests was to prove that the constants got by the use of the machine were as reliable as those obtained with more labour by the ordinary methods of calculation. An account of the most important of these trials, referring to the year 1876, was published as an Appendix to the Quarterly Weather Report for 1876; and the subject is also dealt with in a paper by Mr. R. H. Scott and Mr. R. H. Curtis "On the Working of the Harmonic Analyser at the Meteorological Office," which will be found in the "Proceedings of the Royal Society," Vol. XL p. 382, where may also be found a brief description of the machine and of the method employed in using it.

The coefficients which are given in the following pages supply a complete series of the results hitherto obtained by the machine, and with the exception of those for 1876 just referred to now appear for the first time. But the coefficients which are now given for 1876 were obtained by passing the curves a second time through the machine, and they differ slightly from those published previously, and are also corrected for the non-periodic variation of temperature, which was not done in the earlier computation.

The present results are comprised in three sets of tables, as follows:—

In Table I. will be found the coefficients of the formula expressing the diurnal march of temperature, including the mean, and the first three pairs of terms involving the sines and cosines of the multiples of θ, which is the extent of the range of the machine. To all the coefficients the necessary corrections have been applied for the purpose of disengaging the periodic from the non periodic variations.

In Table II. the equivalents of these coefficients are given adapted to the equation:

$$E = A + B_1 \sin(\theta + C_1) + B_2 \sin(2\theta + C_2) + B_3 \sin(3\theta + C_3) + \text{\&c.}$$

Table III. contains a comparison of the monthly means obtained from the machine with those got by calculation in the ordinary way from the 24 hourly measurements of the curves, and it affords some test of the degree of accuracy to which the machine works.

With reference to this last table it may be remarked that the relatively large differences exhibited by the comparison of the results of the earlier years are mainly due to the fact that in those years the method of measuring the hourly values from the curves from which the calculated means were obtained, was less accurate than in the later years; and at the same time, with the larger amount of data available for the purpose, it has been possible in the later years to determine more accurately than at first, the scale-values of the curves and of the datum lines upon them, on which the reductions of the results obtained by the machine mainly depend. In the later years it will be found that the differences are, as a rule, less than a tenth of a degree.

It should also be noticed that the mean value obtained by means of the machine is the true mean value for the 24 hours commencing at midnight and ending at the following midnight, while the calculated means are derived from the series of hours between 1 a.m. and midnight only. It has not been thought worth while for the purposes of these comparisons to attempt to apply a correction to the means thus calculated; in any case it would be extremely small.

TABLE I.

COEFFICIENTS of the FORMULA expressing the MEAN DIURNAL RANGE of TEMPERATURE for each MONTH of the YEAR.

$$E = a_0 + a_1 \cos\theta + b_1 \sin\theta + a_2 \cos 2\theta + b_2 \sin 2\theta + a_3 \cos 3\theta + b_3 \sin 3\theta.$$

1871.

TABLE II.

CONSTANTS of the FORMULA :—

$$E = A + B_1 \sin(\theta + C_1) + B_2 \sin(2\theta + C_2) + B_3 \sin(3\theta + C_3),$$

expressing the MEAN DIURNAL RANGE of TEMPERATURE for each MONTH of the YEAR, transformed from the COEFFICIENTS in TABLE I. by the FORMULÆ :—

$$A = a_0;\ B_1 = \sqrt{a_1^2 + b_1^2};\ \tan C_1 = \frac{a_1}{b_1};\ \&c.$$

1871.

* New mean, obtained from re-measurement of the curves, 47°·79. The photography of the curves was bad all through the month.
† Do. Do. 58°·09. Do.
‡ Mean for 29 days only.
§ These curves when passed through the Analyser a second time yielded practically the same results.

* Mean for 28 days only.
† Do. 30 do.
‡ Do. 27 do.

* Mean for 29 days only.
† Bad photography.
‡ The curves for this month when passed through the Analyser a second time yielded practically the same results.

* Mean for 29 days only.
† The upper zero lines were used throughout the year, and therefore the length of the ordinates was unusually great in the winter months.

* Curves broken, and difficult to follow with the pointer of the analyser.
† Probable mean.

1875.
